

Aim:

To draw the use case diagram based on the problem statement.

Procedure:

1. Identify the system or application to be modeled.
2. Define the system boundary (draw a rectangle representing the system).
3. Identify all actors (users or external systems interacting with the system).
4. Draw actors using stick figures outside the system boundary.
5. Identify the use cases (functionalities the system provides).
6. Draw use cases as ovals inside the system boundary.
7. Connect actors to use cases using association lines.
8. Identify relationships like <<include>> and <<extend>> between use cases.
9. Add generalization if actors or use cases have inheritance relationships.
10. Label all elements clearly for better understanding.
11. Review the diagram to ensure all functionalities and interactions are covered.
12. Refine and simplify the diagram for clarity.

**Result:**

Thus, the use case diagram has been drawn successfully.
