

Sequence Diagram

Aim:

To model time-ordered interactions between system components, validating message flow, lifeline activation, and control logic for a given use case.

Procedure:

1. Identify actors, objects, and their lifelines; define interaction scope.
2. Sequence synchronous/asynchronous messages, returns, and alt/opt/loop fragments.
3. Annotate activation bars, self-calls, and destruction events; verify temporal consistency.
4. Export/render the diagram and capture a snapshot for documentation or review.

Output:

Result:

A validated sequence diagram snapshot showing end-to-end interaction flow, with clear lifelines, message arrows, activation periods, and control logic for the targeted scenario.
